ESC3002: Mobile Programming II

February 27, 2026

What was Learned

While developing this project I have gained a detailed insight on the flutter framework and the dart programming language, it was interesting to see how it differentiates from react native and how simpler dart was once you got used to it, it was more similar to a web programming language rather than mobile development language.

Challenges

During the project the most difficult part for me was switching from the Visual Studio Code IDE to the online Dartpad IDE for most of the development process as Android studio did not update in realtime so the only way to see a change was to re-run the flutter run terminal command to reload the emulator which took up a lot of time. Another challenge that I had was trying to fix where each bracket/curly bracket should go, as it seemed all over the place when I was coding, since it's more of a class based language a brace is used in almost every function.

Conclusion

Overall it was a good project that strengthened my understanding on the framework, which will definitely come in handy later on within the course.
